

Certain tasks are
easier in some
languages

Choose wisely!

Unpivoting is a common operation

Change this

| | Item | 202110 | 202111 | 202112 | 202201 | 202202 | 202203 |
|---|------|--------|--------|--------|--------|--------|--------|
| 1 | A | 1 | 2 | 4 | 2 | 3 | 4 |
| 2 | B | 2 | 4 | 8 | | | |
| 3 | C | 3 | 6 | 12 | | | |
| 4 | D | 4 | 8 | 16 | | | |
| 5 | E | 5 | 10 | 20 | | | |
| 6 | A | NULL | NULL | NULL | | | |
| 7 | D | NULL | NULL | NULL | | | |
| 8 | E | NULL | NULL | NULL | | | |

To this

| | Item | YearMonth | RawValue |
|----|------|-----------|----------|
| 1 | A | 202110 | 1 |
| 2 | A | 202111 | 2 |
| 3 | A | 202112 | 4 |
| 4 | A | 202201 | 2 |
| 5 | A | 202202 | 3 |
| 6 | A | 202203 | 4 |
| 7 | B | 202110 | 2 |
| 8 | B | 202111 | 4 |
| 9 | B | 202112 | 8 |
| 10 | B | 202201 | 4 |

Let's compare:

SQL Server

PostgreSQL

Excel

M

Python

R

SQL (SQL Server)

```
DECLARE @sql nvarchar(4000);  
  
SELECT @sql =  
    'SELECT Item, YearMonth, RawValue  
    FROM source  
    UNPIVOT  
    (RawValue FOR YearMonth IN (' + cols + ')) unpvt'  
FROM (  
    SELECT STRING_AGG(QUOTENAME(COLUMN_NAME), ', ') as cols  
    FROM INFORMATION_SCHEMA.COLUMNS  
    WHERE TABLE_NAME = 'source'  
    AND COLUMN_NAME <> 'Item'  
) c;  
  
EXEC(@sql);
```

Select the result of the UNPIVOT into a variable

Concatenate the non-ID column names with a dynamic UNPIVOT query

Retrieve non-ID column names from INFORMATION_SCHEMA, then aggregate into a single comma-separated value

Execute the dynamic SQL

SQL (PostgreSQL)

```
WITH  
json_rows AS  
(SELECT  
    row_to_json(df) AS row_json  
FROM df),
```

Convert each row in the table to a JSON object with a {key:value} pair per column/row

```
item_tuples AS  
(SELECT  
    row_json->>'item' AS item,  
    json_each_text(row_json) AS tuple  
FROM json_rows)
```

Extract the ID column and produce one row per {key:value} pair in the JSON

```
SELECT  
    item,  
    (tuple).key AS yearmonth,  
    (tuple).value  
FROM item_tuples  
WHERE (tuple).key != 'item';
```

Extract the key and value into separate columns

Excel

Data without the
header row

```
=LET(  
    dat, A1:G9,  
    df, DROP(dat, 1),  
    fn, LAMBDA(ym,  
        HSTACK(  
            TAKE(df, , 1),  
            EXPAND(ym, ROWS(df), 1, ym),  
            FILTER(df, TAKE(dat, 1) = ym)  
        )),  
    REDUCE(  
        fn(INDEX(dat, 1, 2)),  
        DROP(TAKE(dat, 1), , 2),,  
        LAMBDA(a, b, VSTACK(a, fn(b)))  
    )  
)
```

Convert one input
column to one "stack"
in the output

Processed output for
the first YearMonth

Remaining
YearMonths
to process

Stack all the processed
months together

M

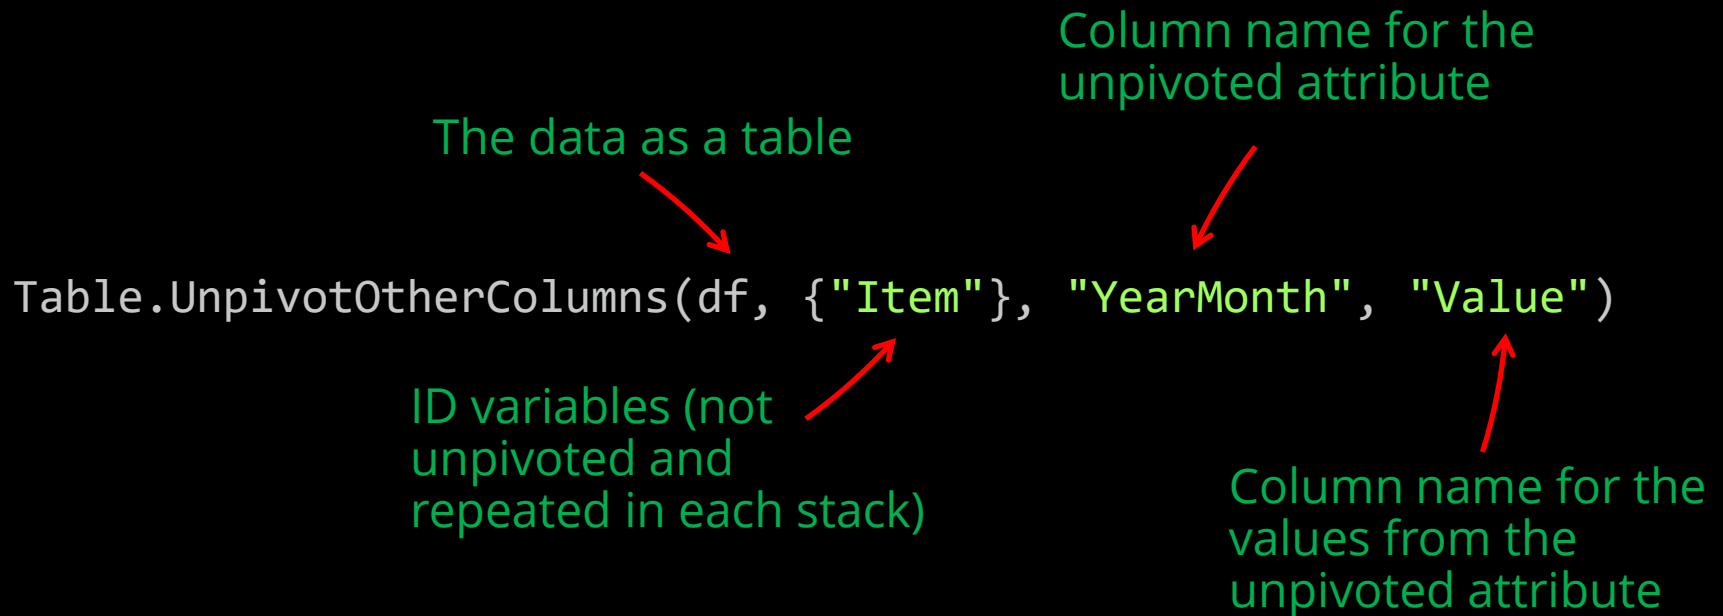

The data as a table

Column name for the unpivoted attribute

```
Table.UnpivotOtherColumns(df, {"Item"}, "YearMonth", "Value")
```

ID variables (not unpivoted and repeated in each stack)

Column name for the values from the unpivoted attribute

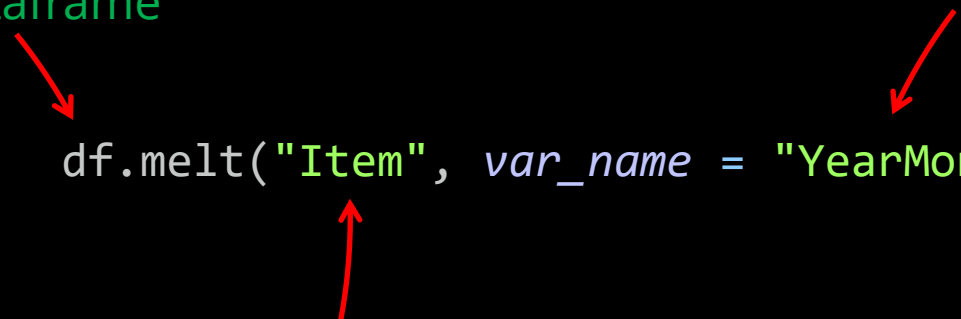

The diagram illustrates the parameters of the `Table.UnpivotOtherColumns` function. Red arrows point from descriptive text to the arguments in the function call: `df` is identified as 'The data as a table', `{"Item"}` as 'ID variables (not unpivoted and repeated in each stack)', `"YearMonth"` as 'Column name for the unpivoted attribute', and `"Value"` as 'Column name for the values from the unpivoted attribute'.

Python

The data as a
Pandas dataframe

Column name for the
unpivoted attribute

```
df.melt("Item", var_name = "YearMonth")
```

ID variables (not
unpivoted, repeated in
each stack)

R

The data as a
dataframe

Column name for the
unpivoted attribute

```
melt(df, variable.name = 'YearMonth', id = 'Item')
```

ID variables (not
unpivoted, repeated in
each stack)
